Abstract
This paper investigated agricultural export performance on economic growth of Nigeria for the period 1980 to 2016. The objective is to investigate the contribution of agricultural export performance on economic growth. Empirical test of the long run and short run relationship were carried out, using time series econometric techniques of co-integration, error correction estimation and ordinary least Square Regression Analysis. The results from unit root test show that all variables are order one integrated, Johansen cointegration shows the existence of long run relations among the variables and error correction estimation suggests the validity of long- run equilibrium relationship among the variables and that estimated coefficient of the error correction of 56 percent suggests that the system corrects itself by about 56 percent speed of adjustment. Finally, Ordinary Least Square Regression Analysis indicates that there is a positive and significant link between agricultural export performance and economic growth in Nigeria. The key finding in this study show that Agriculture export performance had a positive and significant effect on economic growth in Nigeria. The significance of the study is the facts that there is renewed effort by the government to revamp the sector and increase the level of agricultural exports. Moreover, the study applied the most recent data to explore the importance of agricultural exports performance on economic growth. The paper recommends an increase effort to be directed towards policies that will expand the volume of a country’s agricultural exports and at the same time increase public/private participation in the sector.

Keywords: Agriculture Export, Economic Growth, Export Performance, Error Correction

INTRODUCTION
A strong and an efficient agricultural sector would enable a country to feed its growing population, generate employment, earn foreign exchange and provide raw materials for industries. Nigeria is generously endowed with abundant natural resources including biological and non-biological resources. The resources of the entire world should be developed to the fullest extent possible with available means as a whole can progress only by the efficient and rational use of the natural resources. Hence, agriculture constitutes one of the most important sectors of the Nigeria economy (Olajide, 2015).

The significance of agriculture resource in bringing about economic growth and sustainable development of a nation cannot be underestimated. Agriculture contributes to the growth of the economy, provides employment opportunities for the teeming population, export revenue earnings and eradicates poverty in the economy. Adebayo (2010) stated that stagnation in agriculture is the principal explanation for poor economic performance, while rising agricultural productivity has been the most important concomitant of successful industrialization. Oji-Okoro (2011) is of the opinion that agriculture resource has been an important sector in the Nigerian economy in the past decades, and is still a major sector despite the oil boom; basically it provides employment opportunities for the teeming population, eradicates poverty and contributes to the growth of the economy. The pervasive influence of agriculture on Nigeria’s economic and social development has also been articulated by Oluwasami (1966).

The Government of Nigeria, after years of benign neglect, began to reform the agriculture sector. To refocus the sector, the Government implemented a new strategy, The Anchor Borrowers Programme launched in November 2016, for small farmers to advance their status from small holder farmers to commercial or large growers. This however is in line with the CBN programme aimed at creating an Ecosystem to line out-
growers (small holder farmers) to local processors. It is also aimed at diversifying the economy by addressing local production of agricultural products. Another Agriculture Roadmap “the Green Alternative” an Agriculture Promotion Policy (2016-2020) the vision was to revive agric sector to boost food production in the country. The policy will serve as the new fulcrum for Economic Diversification inclusive growth and sustainable development in the sector.

Rostow (1960) argued that in the process of economic development, nations pass through several stages namely: traditional stage, the precondition for take-off, the take off stage, drive to maturity and the high mass consumption stage. Agriculture played crucial roles in the take off stage, drive to maturity and post take off stages). The agricultural sector has the potential to be the industrial and economic springboard from which a country’s development can take off. Indeed, more often than not, agricultural activities are usually concentrated in the less-developed rural areas where there is a critical need for rural transformation, redistribution, poverty alleviation and socio-economic development. (Stewart, 2000)

Literatures have reported that in spite of Nigeria’s rich agricultural resource endowment, there has been a gradual decline in agriculture's contributions to the nation's economy (Manyong et al., 2005). Less than 50% of the Nigeria’s cultivable agricultural land is under cultivation. Even then, smallholder and traditional farmers who use rudimentary production techniques, with resultant low yields, cultivate most of this land. The smallholder farmers are constrained by many problems including those of poor access to modern inputs and credit, poor infrastructure, inadequate access to markets, land and environmental degradation, and inadequate research and extension services. The objective of this study is to examine the impact of agricultural sector performance on the economic growth in Nigeria.

Motivation for the study
There are many existing literature on the subject matter of agricultural export and economic growth, but not without a controversy on whether agricultural export has an impact on economic growth or not. Although majority of these studies agree that agricultural export has a positive impact on economic growth, such view are support by victor (2012), Oluwaseun et al al (2013), Abiodun and Solomon (2010) and Loto (2011) in their studies on Nigeria. However, all the Empirical literatures pointed out that export performance of agricultural sector in the Nigeria economy have been positive, but not significant effect on economic growth in Nigeria. The reason may not be far away from the neglect of the sector by the previous administration as pointed out by Maimuna and Benedict (2015). Amutul and Saif (2015) also supported this view in their studies on Indian economy. Contrary Seeid and Leelavathi (2013) and Muhammad (2015) in their studies in India and Pakistan respectively found that agricultural export does not actually affect the level of economic growth in those countries. With this contrivance on the relationship between agricultural export and economic couple with the recent policies implemented in the sector. It calls for the investigation on the relationship between agricultural export and economic growth in Nigeria.

THEORETICAL FRAME WORK
To investigate the contribution of agricultural exports to economic growth the study starts with the work, neo-classical growth model developed by Solow (1956). The neo-classical production function is specified in terms of traditional inputs like labour and capital.

\[ Y = (L, K) \]  

(1)

The aim of the present study is to derive a source of growth equation which can be estimated, and explore how agricultural exports affect economic growth also. Solow’s aggregate production by incorporating both agricultural and non-agricultural exports.

\[ Y_t = (L_t, K_t, X_t) \]  

(2)

By taking the natural logs (ln) on both sides of the equation (3) in order to rule-out the differences in the units of measurements for our variables, it leads us to Model Specification.

Data Source
Model Specification
The model of this study is specified as:

\[ \log \text{GDP} = \log a_0 + a_1 \log \text{AGOUP} + a_2 \log \text{AXPT} + a_3 \log \text{GEXP} + a_4 \log \text{AGEXP} + e \]  

\[ (3) \]

Where: \( a_0, a_1, a_2, a_3, a_4, a_5 > 0 \)

GDP = Gross Domestic Product
AGOUP = Agriculture Output
AEXP = Agricultural Exports
GEXP = Government Expenditure
AGEXP = Agriculture Expenditure
\( e \) = Error Term

In order to explore the short run and long run relationship between agricultural sector exports and economic growth, study used estimation procedures and the techniques of time series data analysis. Unit root test is applied to check the stationarity in the data. We have applied Co-Integration technique in order to determine the long run relationship. Furthermore, the Error Correction Model is used to estimate the equation to measure the short run impact of variables and the speed of adjustment as represented by \( E(-1) \). To examine the agricultural sector export performance on economic

The Stationarity test revealed that all the variables under investigation are found to be stationary at first difference I(1). Hence, this provides the bases for conducting cointegration test to determine the long term relationship between the variable under investigation.

**Jan-Hansen Cointegration Test**

The result of cointegration test shows that there are three cointegrating equation at 5% (0.05) level of significant, since both the trace statistics and the Max eigenvalue is greater than the critical value. This provides the bases for conducting error correction test to determine the speed of adjustment of the equilibrium.
Error Correction Test.
The estimated coefficient of the error correction term (-0.56) is significantly different from zero at 5 percent level and with the appropriate negative sign. This suggests the validity of long run equilibrium relationship among the variables. The estimated coefficient value of -0.56 suggests that the system (economy) corrects its previous period disequilibrium by about 56 percent speed of adjustment in a year which can be considered a low speed of adjustment of economy. That indicates that results of the ECM estimation are appropriately signed and all the parameter are in conformity with the apriori expectation.

Serial Correlation
The result of Breusch-Godfrey Serial Correlation LM Test shows that there is no presence of serial correlation as indicated by high probability value of 0.9412. This implies that the null hypothesis of no serial correlation is accepted at 5% significant level.

Ordinary Least Square Analysis
The result OLS revealed that there is positive relationship between agricultural output, agricultural export, government expenditure, Agricultural expenditure and GDP. This implies that 100 per cent change in agricultural output would increase GDP by 62.3, 100 per cent change in agricultural export would increase GDP by 30.1 per cent. 100 per cent increase in agricultural expenditure would increase GDP by 7.4 per cent and100 per cent; change in government expenditure would increase GDP by 2.6 per cent. The value of intercept or constant of 2.623648 shows the rate at which GDP changes when agricultural output, agricultural export, government expenditure are held constant. The coefficients of all independent variables such as agricultural output, agricultural export, government expenditure, Agricultural expenditure are rightly signed and are consistent with the theoretical expectation of this study.

The coefficients of agricultural output, agricultural export, Agricultural expenditure and constant are statistically significant at 1 per cent level as indicated by probability value of 0.0000, 0.0043, 0.0006, 0.0929, 0.0205 respectively. Thus the null hypotheses were rejected. But government expenditure is statistically insignificant at 5 per cent level. Because there probability values of 0.9029 is greater than 0.05 per cent. Therefore, the null hypothesis is accepted.
The F-statistic 1046.100 which is a measure of the joint significance of the explanatory variables, is found to be statistically significant at 1 per cent level as indicated by the corresponding probability value of 0.000000. Hence, accept that the independent variables are simultaneously significant. The $R^2$ of 0.969906 (96.9%) implies that about 96.9 per cent total variation in GDP is explained by the regression equation. Coincidentally, the goodness of fit of the regression remained high after adjusting for the degree of freedom as indicated by the adjusted $R^2$ ($R^2 = 0.958960$ or 95.8%).

The Durbin-Watson statistic of 1.652806 in the result above is observed to be greater than $R^2$.969906 indicating that the model is not spurious (i.e. it is meaningful). This implies that the model can be used for policy purpose. From the result, it shows that there is presence of auto correlation because Durbin-Watson statistic 1.652806 is less than two. This provides the basis for conducting serial correlation test.

**DISCUSSION OF THE FINDINGS**

The result of this study shows that increase in agricultural output, agricultural export, Agricultural expenditure and government expenditure affect GDP positively over the years in Nigeria. Meanwhile, agricultural output, and agricultural export, has significant and positive impact on GDP in Nigeria for the period under review, while government expenditure has positive and insignificant impact on GDP. Moreover, all the variables are found to be stationary at first difference I(1) after conducting unit root test. Janhansen cointegration test was conducted which shows that there are three cointegrating equation at 5% level. The result of the error correction revealed that the economy would restore it previous disequilibrium by about 56% speed of adjustment.

**CONCLUSION AND RECOMMENDATION**

The paper investigates the relationship between agricultural export and economic growth in Nigeria using OLS and ECM. The result stationary test found all variable to be at first difference I(1) after conducting unit root test. Janhansen cointegration test found that there are three cointegrating equation at 5% level, indicating a long run relationship between the variables and error correction reveals that the economy would restore it previous disequilibrium by about 56% speed of adjustment.

Moreover, the OLS result found that there is a positive, strong and significant link between economic growth and agricultural export in Nigeria, implying that if government increase spending in agricultural sector and other sub-sector it will boost agricultural export and economic growth of Nigeria. In the light of this finding, the paper recommend that both the private sector and the government need to increase the level investment.
and expenditure in the sector in order to improve agricultural sector export and economic performance of Nigeria.
